

Gatherly Mobile is in the beta testing phase, which means a group of users (8 users in our case) are using and testing the application at any given point during the day on their smartphones. Installing an application with the apk comes with its own set of problems and we at fordFanatics understand the frustrating situation. Listed below are few problems that we anticipate that you will run into and our proposed solutions courtesy of Android app development tools, Google, and Stackoverflow.

- **Application is running fine in emulators and even in real devices installed by android studio but it crashed if installed manually using apk file.**
  - Look at your logcat and identify the problem, Android SDK is a wonderful tool that will help you recognize the problem and its solution. If it prompts you to install a library or install root directory go ahead and do so.
  - Another tactic is to disable Instant run.  
Android Studio → File → Setting → Build, Execution, Deploy → Instant run.
- **Application crashes too often.**
  - Delete the application from your phone.
  - Delete the apk and any associated folders from the local computer
  - Download the apk again from Github
  - Load it in the Android Studio
  - Connect your phone.
  - Select your device and press Run.
- **Forgot your password?**
  - Don't worry, In the login page type in the email address that was used to register and click on forgot password. Google's Firebase will send a link to reset your password on the listed email address.
